

CS 321 AI PROMPT LOG ENTRY

Name: Sawyer Whiteside

Team / Subsystem: Subsystem 5, Community Forum & Discussion

Date: 10/08/2026

Tool: Claude (Anthropic), claude.ai chat

What I asked:

I asked Claude to work step-by-step in creating a method by which to filter posts by category and had it explain the pipeline required.

I provided Claude with a brief summary of what I believed was required to accomplish this task:

- An html page which has tabs that separate the categories and which can be later used to
- separate the posts by category
- A java file which creates posts and separates them by category, allowing for all of them to be accessed when given a category to search through
- An informational bridge between these two such that the posts contained in the structure of the java file can be transferred to the page and seen under the different categories

What was produced:

Claude produced 4 files which included a UI skeleton of category tabs via an HTML file and a Java file which contained code that allowed for the creation of posts and a main which tested that category dividers were working as intended.

Changed or Rejected:

I did not push the java file as we already have a similar file in our gitHub and I did not want to create any confusion without discussing creating branches or adjusting the original file.

Additionally, it seemed unwise to add any more code to gitHub without creating a pipeline plan for how we plan to get post information from the frontend down to the backend and then update the frontend (a task in which I have no experience).
